Máster de Neurociencias Básicas, Aplicadas y Dolor

Neurosciences constitute a body of knowledge about the nervous system and its functions, from a multidisciplinary perspective. Neuroscience is one of the fastest growing scientific areas with powerful and promising research. The Master of Basic, Applied and Pain Neurosciences includes a teaching staff from 4 Faculties of the University of Granada and 12 different areas of knowledge, as well as professionals from hospitals, private clinics and healthcare centers.

In this Master's degree, we want to highlight the double aspect: basic, in the sense of an approach to the functional foundations of the different structures of the nervous system and clinical, due to its contents specifically focused on the advances in translational research, which allow a better approach to neurological and neuropsychological pathologies. Furthermore, the Master's hallmark is a module of courses specialized in Pain, a symptom that is the first cause of consultation and which is estimated to chronically affect almost 25% of the population.
